DARTSMARTS

"A Superior Dart Produces Superior Results"

PERFECTED MOVEABLE POINT! This spring loaded point can deflect! Other moveable-point systems, due to their collet's design (which locks the point into the center of the barrel), only produces double hits on the exact same spot and bounce outs still occur. In our system, you can hear it work when you hear the barrel hitting the back of the point and then hear the second sound of the dart going forward and hitting the board! Also, our slightly rounded tip of point keeps the point on the surface of the wire and gives our moveable system time to operate!

NEW "FT" PERFORMANCE FLIGHT! This flight allows you to throw a more controlled and flatter trajectory ("FT"). This provides a consistency of flight, less chance of error, and gives you a wider margin of error. Other flight designs out there produce excessive drag due to either too much surface area (standard) or not enough (coal cracker). The dimpled and rib types actually produce turbulence, which will turn into drag. That's why darts are always pointing up at the ceiling after hitting the dartboard!

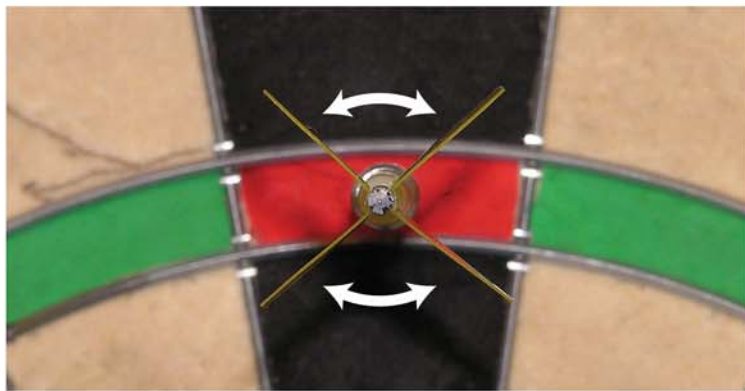

A "3 in 1" DART! - This dart has been designed for all dart games! This dart can be converted into either a "moveable-point" dart, a "fixed-point" dart or it can take a "soft-tip" as well!

A GRIP WITH 600% MORE CONTROL! Due to the designed shape of the 33-grooves per inch, this barrel naturally produces a consistent, controlled release. The barrel pivots on the surface of your skin without losing the maximum forward grip!
TEST: Grip your dart and turn your hand so you can see a "side view." Then make repeated forearm/hand motions as if you were throwing the dart. Watch your thumb-nail pivot on the barrel! This is what actually happens and why this is the only grip that works on a dart!

SELF-SECURING POINT! Darters twist their points in sandpaper so their points remain solid in the board. The grooves that we've machined into our points, now make this a permanent, maintenance-free feature!

REVOLVING BARREL! This barrel, through our moveable point system, operates independently from the point, allowing the dart to rotate out of the way of incoming darts. Spinners aren't needed!
